

<p>Line</p> 	<p>Though seemingly crooked, the lines in the middle are actually straight. Different angles of the vertical lines (and partially the color) contribute to this optical illusion. Since the lines in between were set at different angles, we were given a perception in which the lines in the middle appear to be curved,</p>
<p>Geometric Shape</p> 	<p>We are able to tell that the picture is a bird despite only using basic polygons. Despite not using any major curves, we can still tell the general picture because of the clever placements of the shapes and how they interact with each other.</p>
<p>Organic Shape</p> 	<p>Though geometrical shapes are appealing to the eye due to its "perfection", organic shape can easily achieve that same effect such as this picture in which the curves and the way they swirl from a jellyfish like shape that's both unique and appealing to the eye.</p>
<p>Form</p> 	<p>Though you can only truly appreciate the three dimensional aspects of this picture through special glasses, it still represents a 3D figure. By moving from two dimensional to 3D, you unlock more perspectives to view it from and you are able to compare size ratios more easily</p>

Value

This picture is a great representation of how value can affect the quality of a picture. The left side is clearly less detailed due to less variation in the lightness and darkness in the tones of the color. The right side prove that by introducing value into the picture, you are able to show finer details.

Texture

The perceived surface quality of this picture is amazing with the colors popping out at you like a firework display. It helps express how the colors are going everywhere and you can clearly distinguish what would be its physical qualities. It strongly conveys the feelings of the artist who created it because it's so lively and everywhere.

Primary Color

Using only primary colors, this artist was able to create a bright and interesting display of trees. Though primary colors are the most basic components, they are still able to create a beautiful visual when placed in different patterns such as in this picture.

Warm Color

Warm colors generally point in the direction of a positive and happy picture. Normally when we think warm, we think of colors like red orange and yellow; as colors of the sun they all carry a bright atmosphere (no pun intended) to the picture.

Cool Color

Cool colors give more of a calm, peaceful, and sometimes eerie feeling. In this picture cool colors help convey how it's currently nighttime. It also helps us feel relaxed as we imagine the wind rustling the grass and the quiet night that is almost nonexistent in our urban cities today.

Space

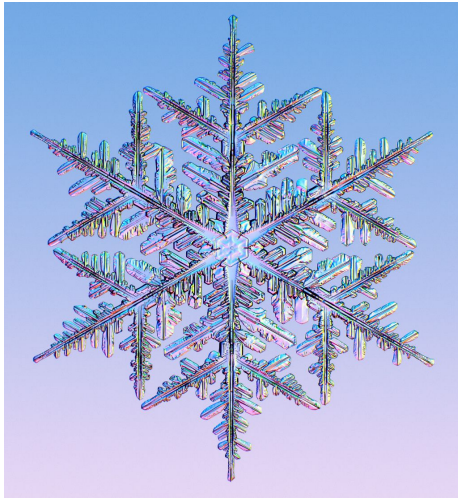

The space in this work of art is amazing as it looks so realistic despite being painted on a floor! In general, space is an important part of the picture because it give a sense of depth which is what this picture is all about.

Space-Depth

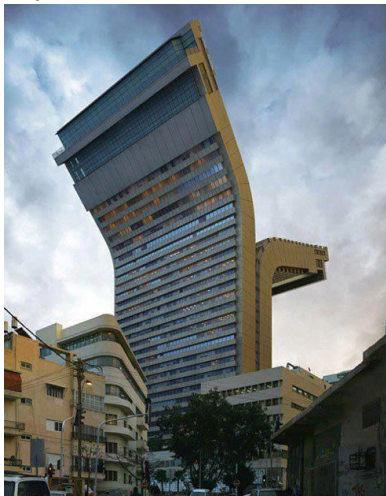

This artwork uses a spiral staircase to introduce depth into the picture. Without this quality, the art would look more flat, less realistic, and overall less appealing. This image particularly draws your eyes to the middle by distancing the staircase and putting up from the perspective of looking down.

Symmetrical Balance

Whenever asked to make a snowflake, we first fold paper a certain way. Symmetry is pleasant to our eye because our minds are naturally more drawn to equal sided images because it's just easier for our brains to process. This picture uses symmetry to bring an overall sense of balance to the picture.

Asymmetrical Balance

This picture has asymmetrical balance in it which give us an opportunity to focus on all parts of the picture. Having asymmetry helps us focus more as we look into the specifics of the picture and compare it to the other side if applicable.

Variety

Having variety in art allows someone to stop looking only at the overall picture but to also focus down on each separate component of it. This is a great example of how a variety of different objects created a new picture that is more detailed and appealing than just one composed of apples.

Movement

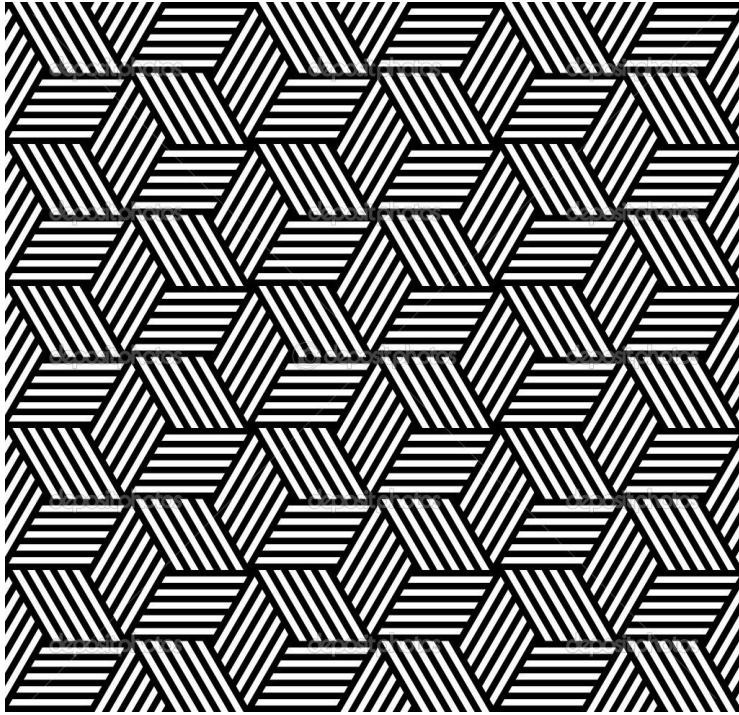

By posing the bird in certain positions such as the one that is about to rouse the flock in this painting, artists can bring a sense of life into their images as we look into the future of their painting to visualize the motion that will follow.

Emphasize/Focal Point

By creating an emphasize on the sun in the middle, we can look how it relates to the bigger picture. The sun is the focal point in this picture and it grabs the reader's eye at first glance.

Pattern and Repetition

The pattern in this picture helps create an eye opening 3D figure that can be viewed from many perspectives. By focusing on different corners of the cubes, you can see how they are facing in different directions, patterns open up other views and can sometimes from a new picture.

Contrast

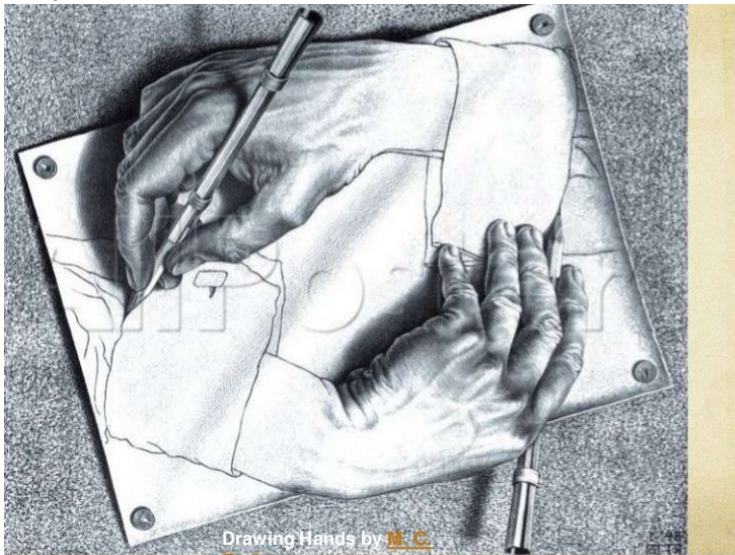

Contrast helps us tell the different seasons in this picture. By setting opposite colors, different seasons are shown with the same general shape and texture. With completely different elements but the same general shape, this piece of art was able to come together.

Economy

Short and sweet in the best phrase for this piece of art. By leaving out any extra and unimportant parts, this picture is able to depict everything with not wasted unrelated tangents that could take away a viewer's attention. It helps keep the components of the picture relevant. In this picture, everything contributes to the main emphasis of the women.

Unity

By having different parts of this piece of art relate to each other, it creates a sense of closure and relation in this picture. It also helps create meaning in the art since all the components work together like a puzzle. In this picture two hands are drawing each other to create a circle of unity.
